

VacuEasylift lifting over shoulder height

This vacuum system is used to lift boxes of curtains weighing about 20 kg into steel crates.

The VacuEasylift is equipped with extended, flexible handle to help reach boxes with lifting surface above shoulder height. The stainless steel bracket helps position the suction foot correctly on top of the boxes.

The vacuum pump has been placed out of the way on a platform shelf on the wall. The air tube connects the vacuum pump to the filter unit and from there to the lift unit.
